Jinka naukri lag laga, Agla target terraform, docker, k8s, pipeline + MLOps = 50 Lakh

Jinka jinka job laga hai apne apne group me help karke sabko uthana hai nahi toh MLOPs cancel..

Topic to teach in Siksha Sathi Group/B17 Main

- Containerization Vs Virtualization ✔
- How and where to install docker ✔
- How to connect VS code to remote server ✔
  - 1. Azure pr jake ek vm banaya.. ✔
  - 2. Uspr Docker install karenge ✔
  - 3. docker --help, docker --version ✔

Jo purana setup hai usi ko optimised way me chalana hai..

application lelve pr ye changes monolithic se microservices ye application architect/enterprise architect karenge..

Infra level jo optimization hoga vo devops, devsecops ya mlops engineer

ek streamflix application ko chalana hai..

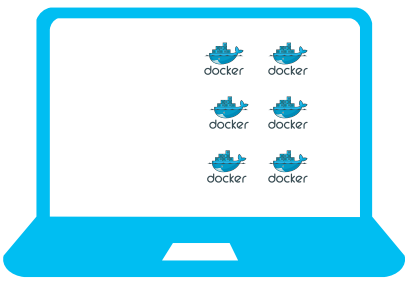
Virtualization	Containerization	Orchestration(K8s)
Azure pr VM banaenge	Azure pr VM banaenge	AKS
VM banane ke lie ek image chahiye marketplace se	VM pr docker dalenge	POD
VM ban gaya	Container ka image DockerHub se laenge	
VM ban ne ke baad login kia..	Container Ban gya	
Nginx install kia..	Usme login karenge	
Readme.md padenge	nginx install kar denge	
machine me login karke code ko home directory ke andar me koi bhi user ka jo folder me jake clone kar lenge	artifacts ko utha ke	
sudo rm -rf *	/var/www/html me dal denge	
sudo cp -r * /var/www/html/		

Image se container banana
Docker Hub kya hota hai..
Docker hub me image kaha hota hai aur kya hota hai..
Docker hub se image leke container kaise banate haii..

Image kya hota hai?

Ab hum VM nginx ke saath image select karke chalate hai aur chalne se bhi problem nahi hatega.. same virtualization wale problem reh jate hai.. hame nginx ko containerization wale concept pr chalana hoga..

VM ke upr me container kaise banega



nginx ka kon sa image lena hai, iska assessment karenge dockerhub pr

ek baar version final ho gya ki yahi deploy karna hai toh image ko pull karenge apne local machine p

docker pull nginx:<version>

docker images

docker run nginx:<version>

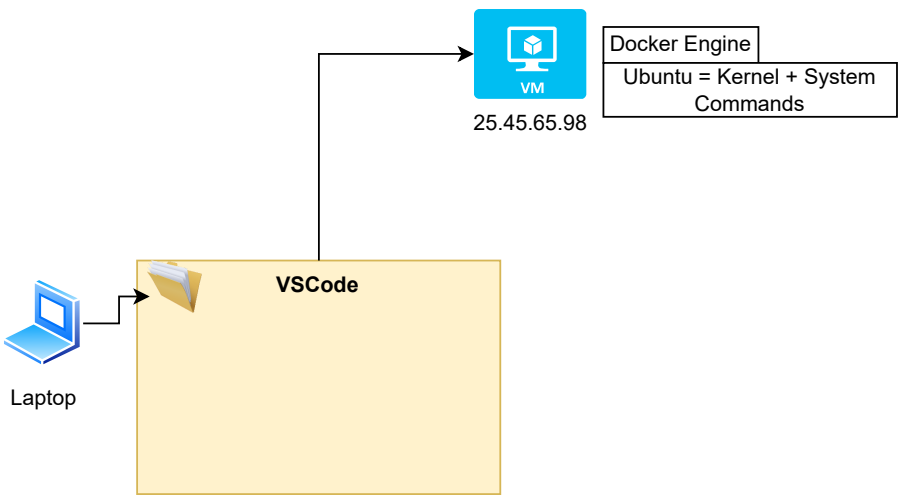
Docker run karte hi container change ho jaega image

Sare container dekhne ke lie docker ps -a karke check kar lenge..

docker ps se check karenge container chl bhi raha hai ki nahi..

Container me login karke ne lie docker exec command use karenge.

docker start, docker stop, docker restart - basic commands..

docker rm - delete container, docker rmi - delete image


docker logs - Logs check karne ke lie..
